

MODUCARE (PLANT STEROLS AND STEROLINS) – THYROID

Condition

Thyroid

Explanation

With both Hashimoto's Disease (hypothyroidism) and Grave's Disease (hyperthyroidism), the body has become confused and sets up an autoimmune attack on the thyroid gland. When this autoimmune reaction is reduced, there is an opportunity for unhampered thyroid production and metabolism.

Sterols and sterolins balance the immune system by decreasing the specific immune factor (Interleukin-6) responsible for the autoimmune reaction. As a result, thyroid function may be allowed to return to a more normal state.
